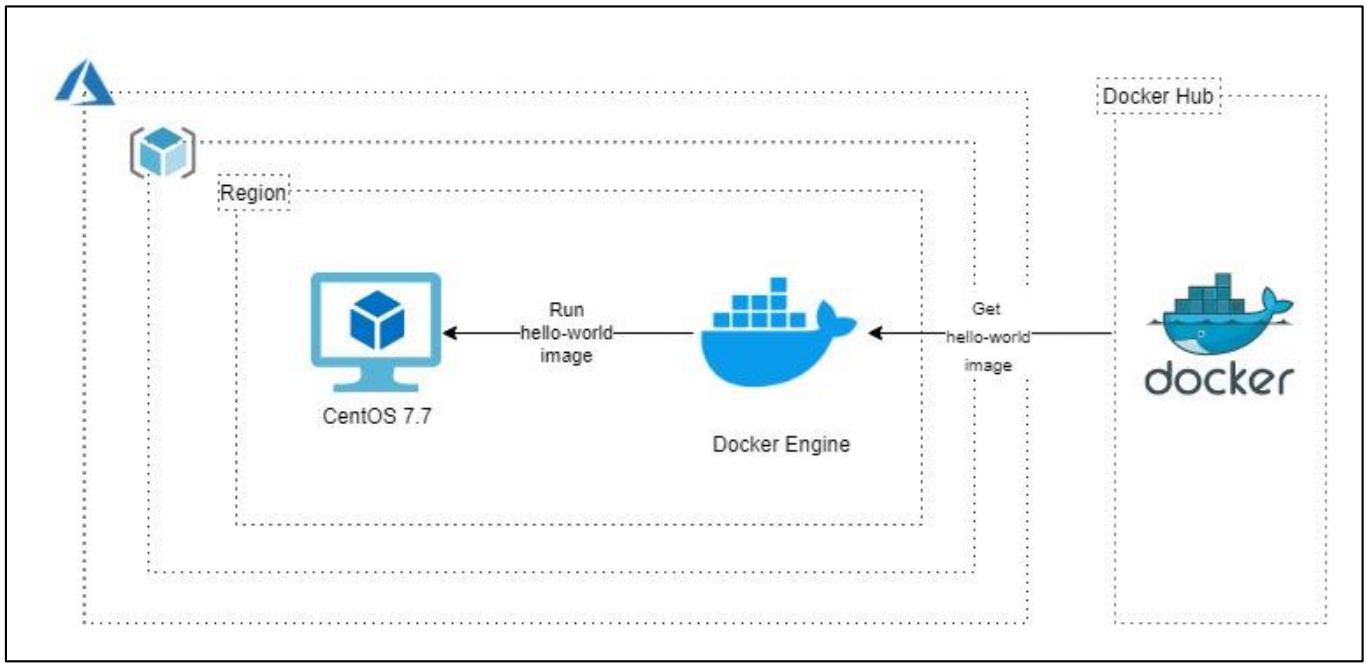
1. Running Your First Docker Container

1.1 Description

Docker Engine is an open source containerization technology for building and containerizing your applications. In this usecase, docker engine is installed in a Linux distribution.

1.2 Architecture Diagram

The diagram below displays a visual representation of the application architecture:



1.3 Lab Steps

Follow the steps outlined below to achieve the objective of this lab exercise:

1. Go to the Azure Portal and create an Ubuntu 18.04 VM.
2. Update the VM:

```
sudo apt-get update
```

3. Install prerequisite packages:

```
sudo apt-get install apt-transport-https ca-certificates curl gnupg lsb-release
```

4. Add Docker's GPG Key:

```
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo gpg --dearmor -o
/usr/share/keyrings/docker-archive-keyring.gpg
```

5. Add the Docker Repository:

```
echo "deb [arch=amd64 signed-by=/usr/share/keyrings/docker-archive-keyring.gpg]
https://download.docker.com/linux/ubuntu $(lsb_release -cs) stable" | sudo tee
/etc/apt/sources.list.d/docker.list > /dev/null
```

6. Update the repo to reflect:

```
sudo apt-get update
```

7. Install Docker Engine:

```
sudo apt-get install docker-ce docker-ce-cli containerd.io
```

8. Check if docker is correctly installed or not:

```
sudo docker run hello-world
```

Note: For any issues with the commands, refer the link in Supporting References section.
