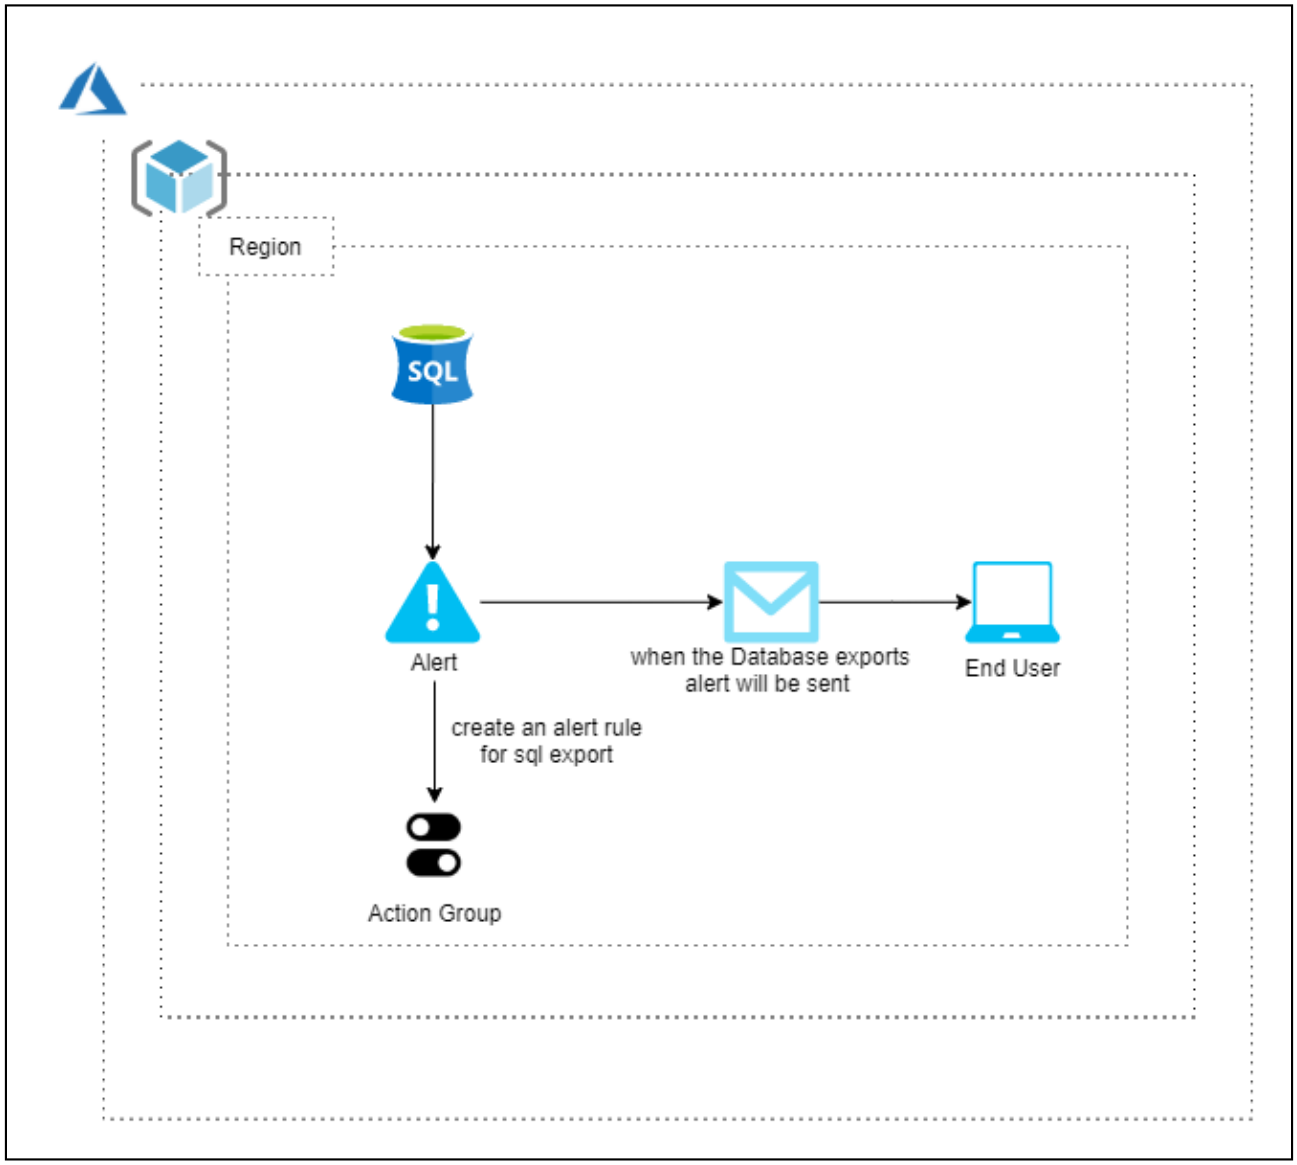
1. Configuring Alerts for Azure SQL

1.1 Description

Azure gives you the ability to alert on several metrics available in your Azure SQL environment. With a few clicks, it can notify you about critical changes or performance issues with your SQL databases, server, data warehouses and more. In this hands-on lab, you will create an alert for your SQL database alerting you via email of an export of your pre-deployed database.

1.2 Architecture Diagram

The diagram below displays a visual representation of the application architecture:



1.3 Lab Steps

Follow the steps outlined below to achieve the objective of this lab exercise:

1. Log in to the Azure portal with the credentials provided.
2. Create an SQL database:
    a. Name: <can be anything>
    b. Resource group: The resource group created for your user (<**Dept**><**empID**>**RG**).
    c. SQL server create new:
        i. Name: <can be anything but unique>
        ii. Username: <can be anything but unique>
        iii. Mention username and password and click **create.**
    d. In **Compute** Option, select **Basic Configuration.**
    e. Review+Create.
3. Click on **+ Add** and search the Azure marketplace for a storage account.
4. Create the storage account with the following parameters:
    a. Subscription: leave to its default value.
    b. Resource group: The resource group of the lab. There will be the only one available.
    c. Storage account name: <name can be anything unique>
    d. Location: **(US) East US**
    e. Performance: **Standard**
    f. Account kind: **StorageV2** (general purpose v2)
    g. Replication: **Locally-redundant storage (LRS)**
5. Click **Review + Create** > **Create** to create the storage account.
6. Go to SQL server you have created and click **Firewalls and virtual networks**.
7. Enable the setting for **Allow Azure services and resources to access this server** to **Yes** and click **Save**.
8. Go to the SQL database you have created and click alerts.
9. Click **Alerts** in the database blade menu.
10. Click on **+ New alert rule** at the top of the pane.
11. Under **Condition**, click **Select Condition**.
12. In the Monitor service dropdown box, select **Activity Log - Administrative**, then click **Export an existing database. (Microsoft.Sql/servers/databases).**
13. Click **Done** to finalize your selection.
14. Under **Action Group**, click **Select action group**.
15. In the Add action group dialog, create an action group with the following parameters:
    a. Action Group name : can be anything
    b. Short name : <can be anything>
    c. Subscription : leave to its default value
    d. Resource Group : <change it to your resource group>
    e. Actions:
        i. Action name: **Emailme**
        ii. Action Type: **Email/SMS message/Push/Voice**
16. In the Email/SMS/Push/Voice dialog that appears, check the box next to **Email** and enter your email address into the **Email** text box.
17. Click **OK** to exit the dialog and **OK** once more to create the action group. You will be returned to the **Create rule** dialog.
18. Give the name of Alert Rule, also give RG name for saving the alert rule.
19. Enable Alert rule upon creation: **Yes**. Click **Create Alert Rule.**
20. While remaining in the SQL database blade, click on **Overview** at the top of the blade menu.
21. Click Export to trigger an export of the SQL database.

22. In the Export database dialog, configure the export with the following parameters:
    a. File name: leave to its default value
    b. Subscription: leave to its default value
    c. Storage: click the storage account you have created
    d. Authentication type: cannot be changed
    e. Server admin login: <your server user name>
    f. Password: <your password>
23. Click **OK** to export the database.
    Note: After exporting an email will be sent to the email address you have given.

1.4 Troubleshooting

S. No	Problem	Solution
1	Facing an issue while creating SQL server or SQL database	Check the region you are using.
